How to Narrow Down What to Test

by
Zsolt Fabok
2013-06-05

@ZsoltFabok

or

#xp2013

“I get paid for code that works, not for tests, so my philosophy is to test as little as possible to reach a given level of confidence (I suspect this level of confidence is high compared to industry standards, but that could just be hubris). If I don’t typically make a kind of mistake (like setting the wrong variables in a constructor), I don’t test for it. I do tend to make sense of test errors, so I’m extra careful when I have logic with complicated conditionals. When coding on a team, I modify my strategy to carefully test code that we, collectively, tend to get wrong.”

Kent Beck - September 10, 2010

quote: http://stackoverflow.com/questions/153234/how-deep-are-your-unit-tests/153565#153565

I’d like to [re]start working on this legacy application

```
Terminal — zsh — 91×33
zsh
~//Race2009 % ant verifier
Buildfile: /Users/zsolt/Race2009/build.xml

clean.java:

verifier:
[harvester] Collect candidates from user repository: /Users/zsolt/Race2009/repository

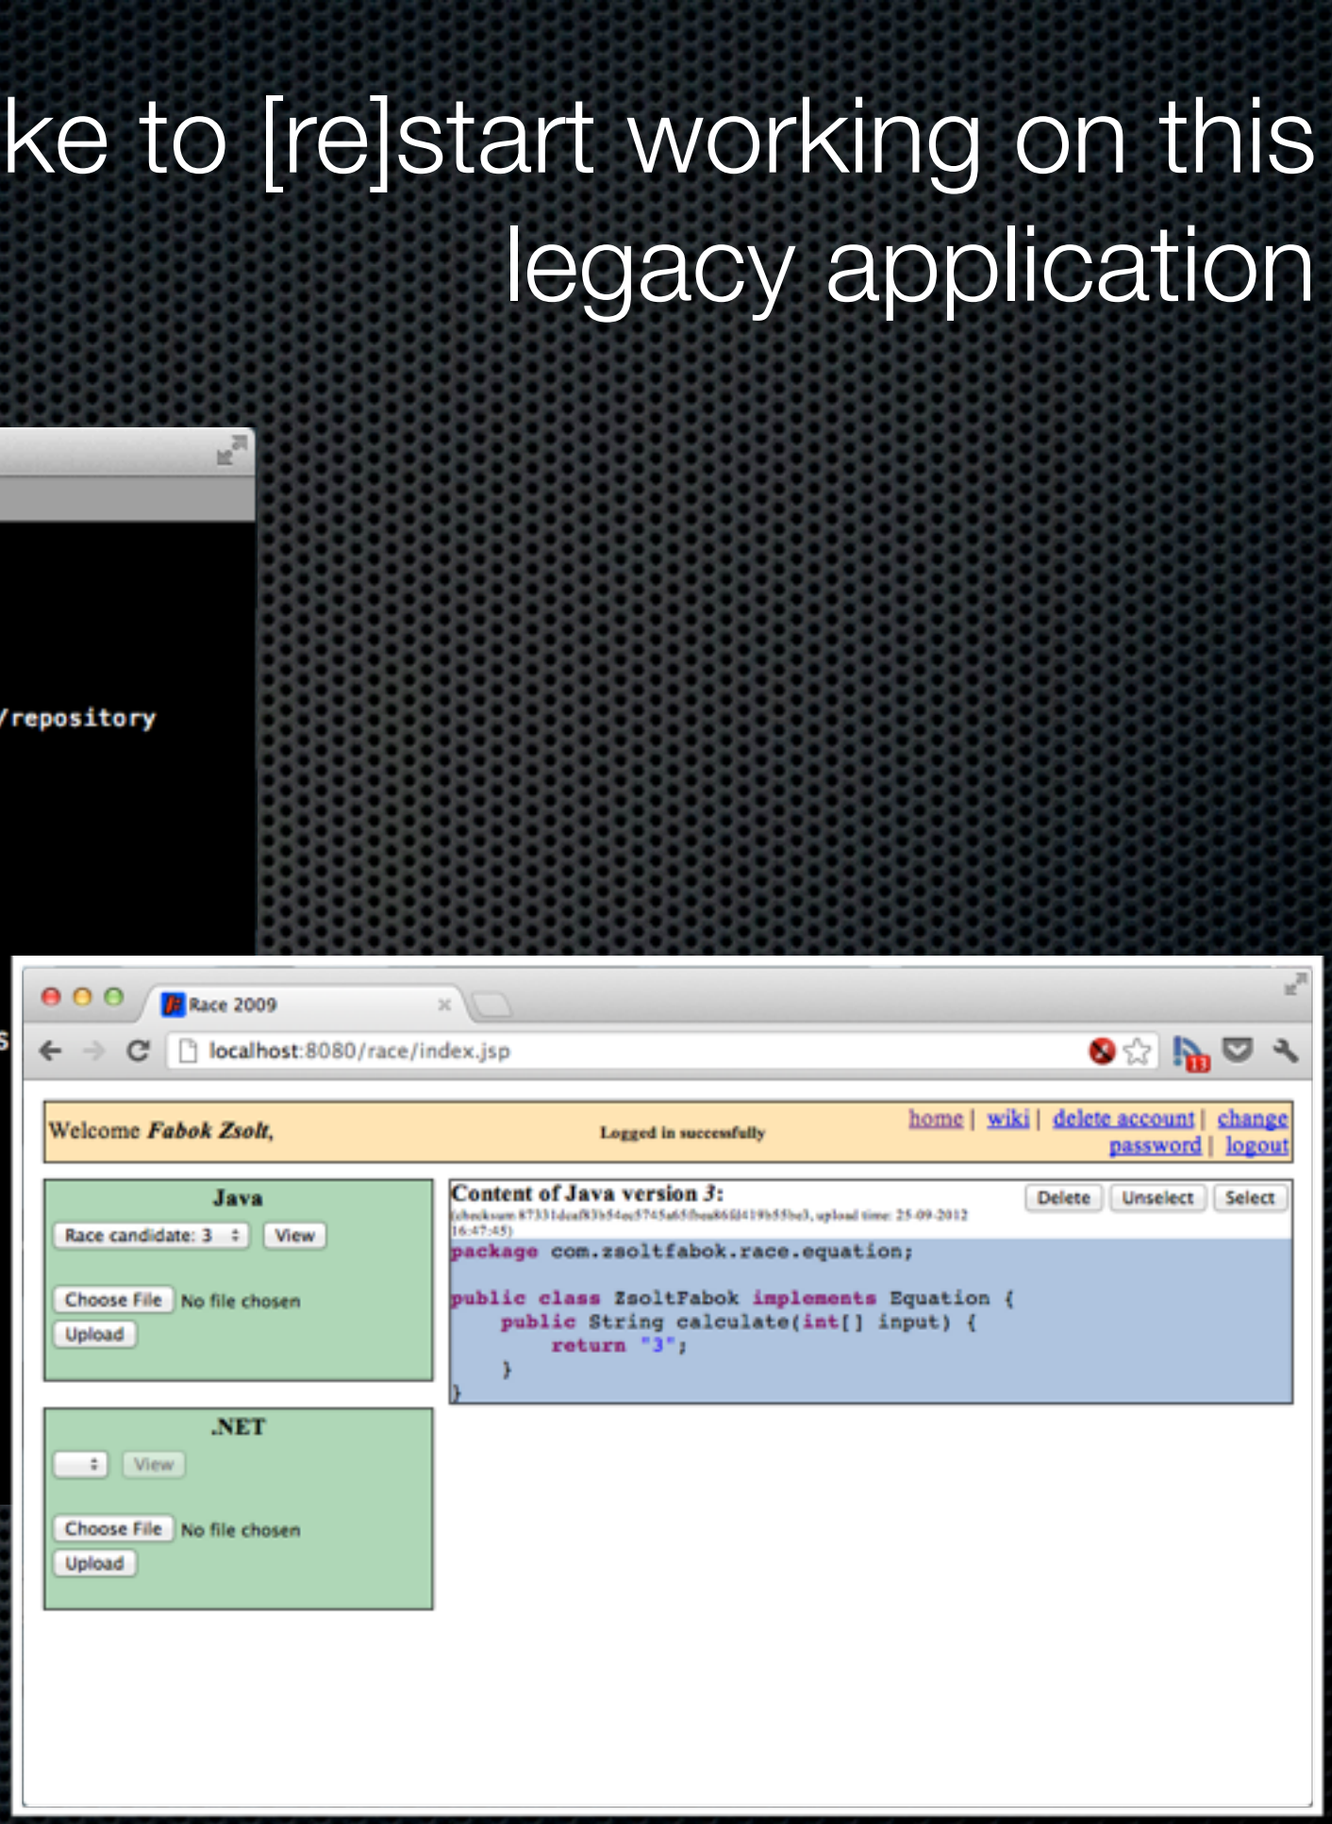
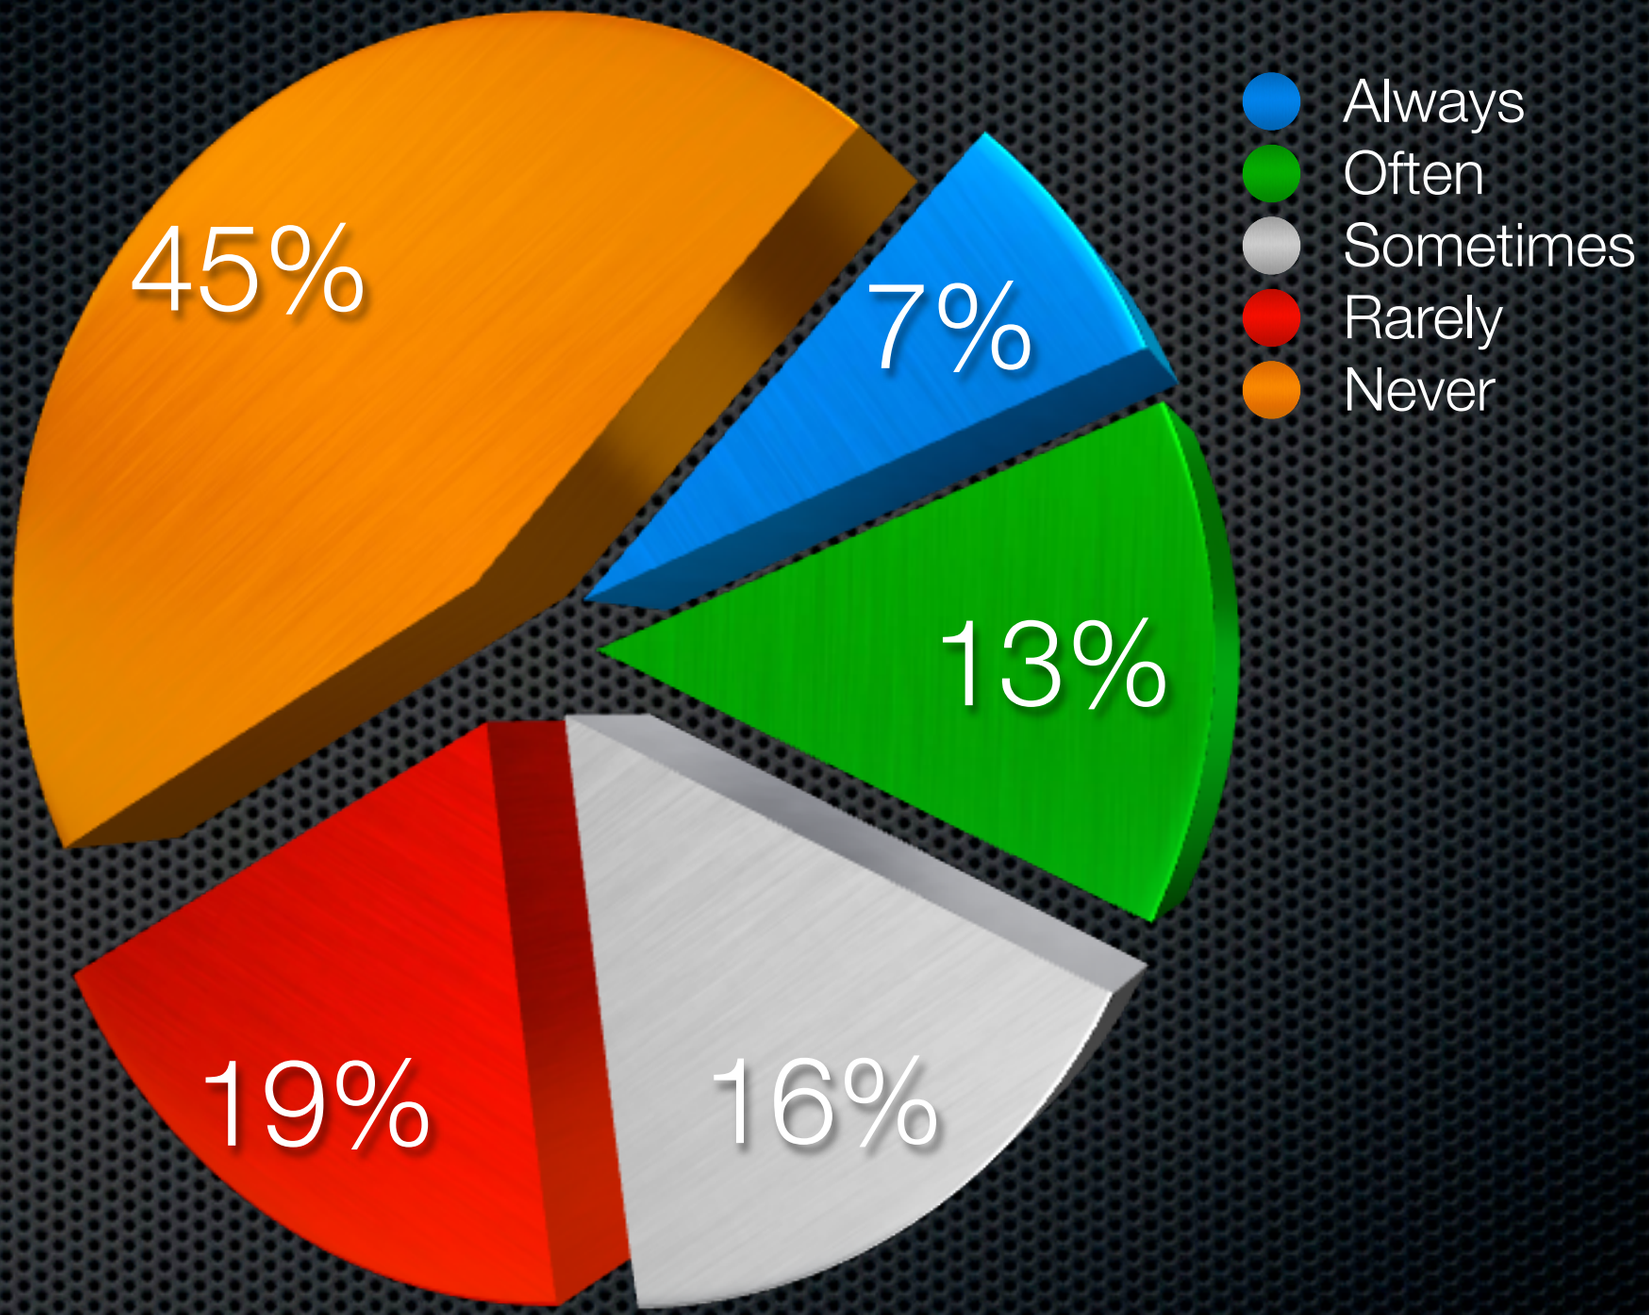
```



My “where to start” list

#1 Determine which parts of the code are really used



The good old Standish Group Study

The goal is to find those features which are always or often used.

By studying coverage, access logs, traces, web analytics, heat maps, etc.

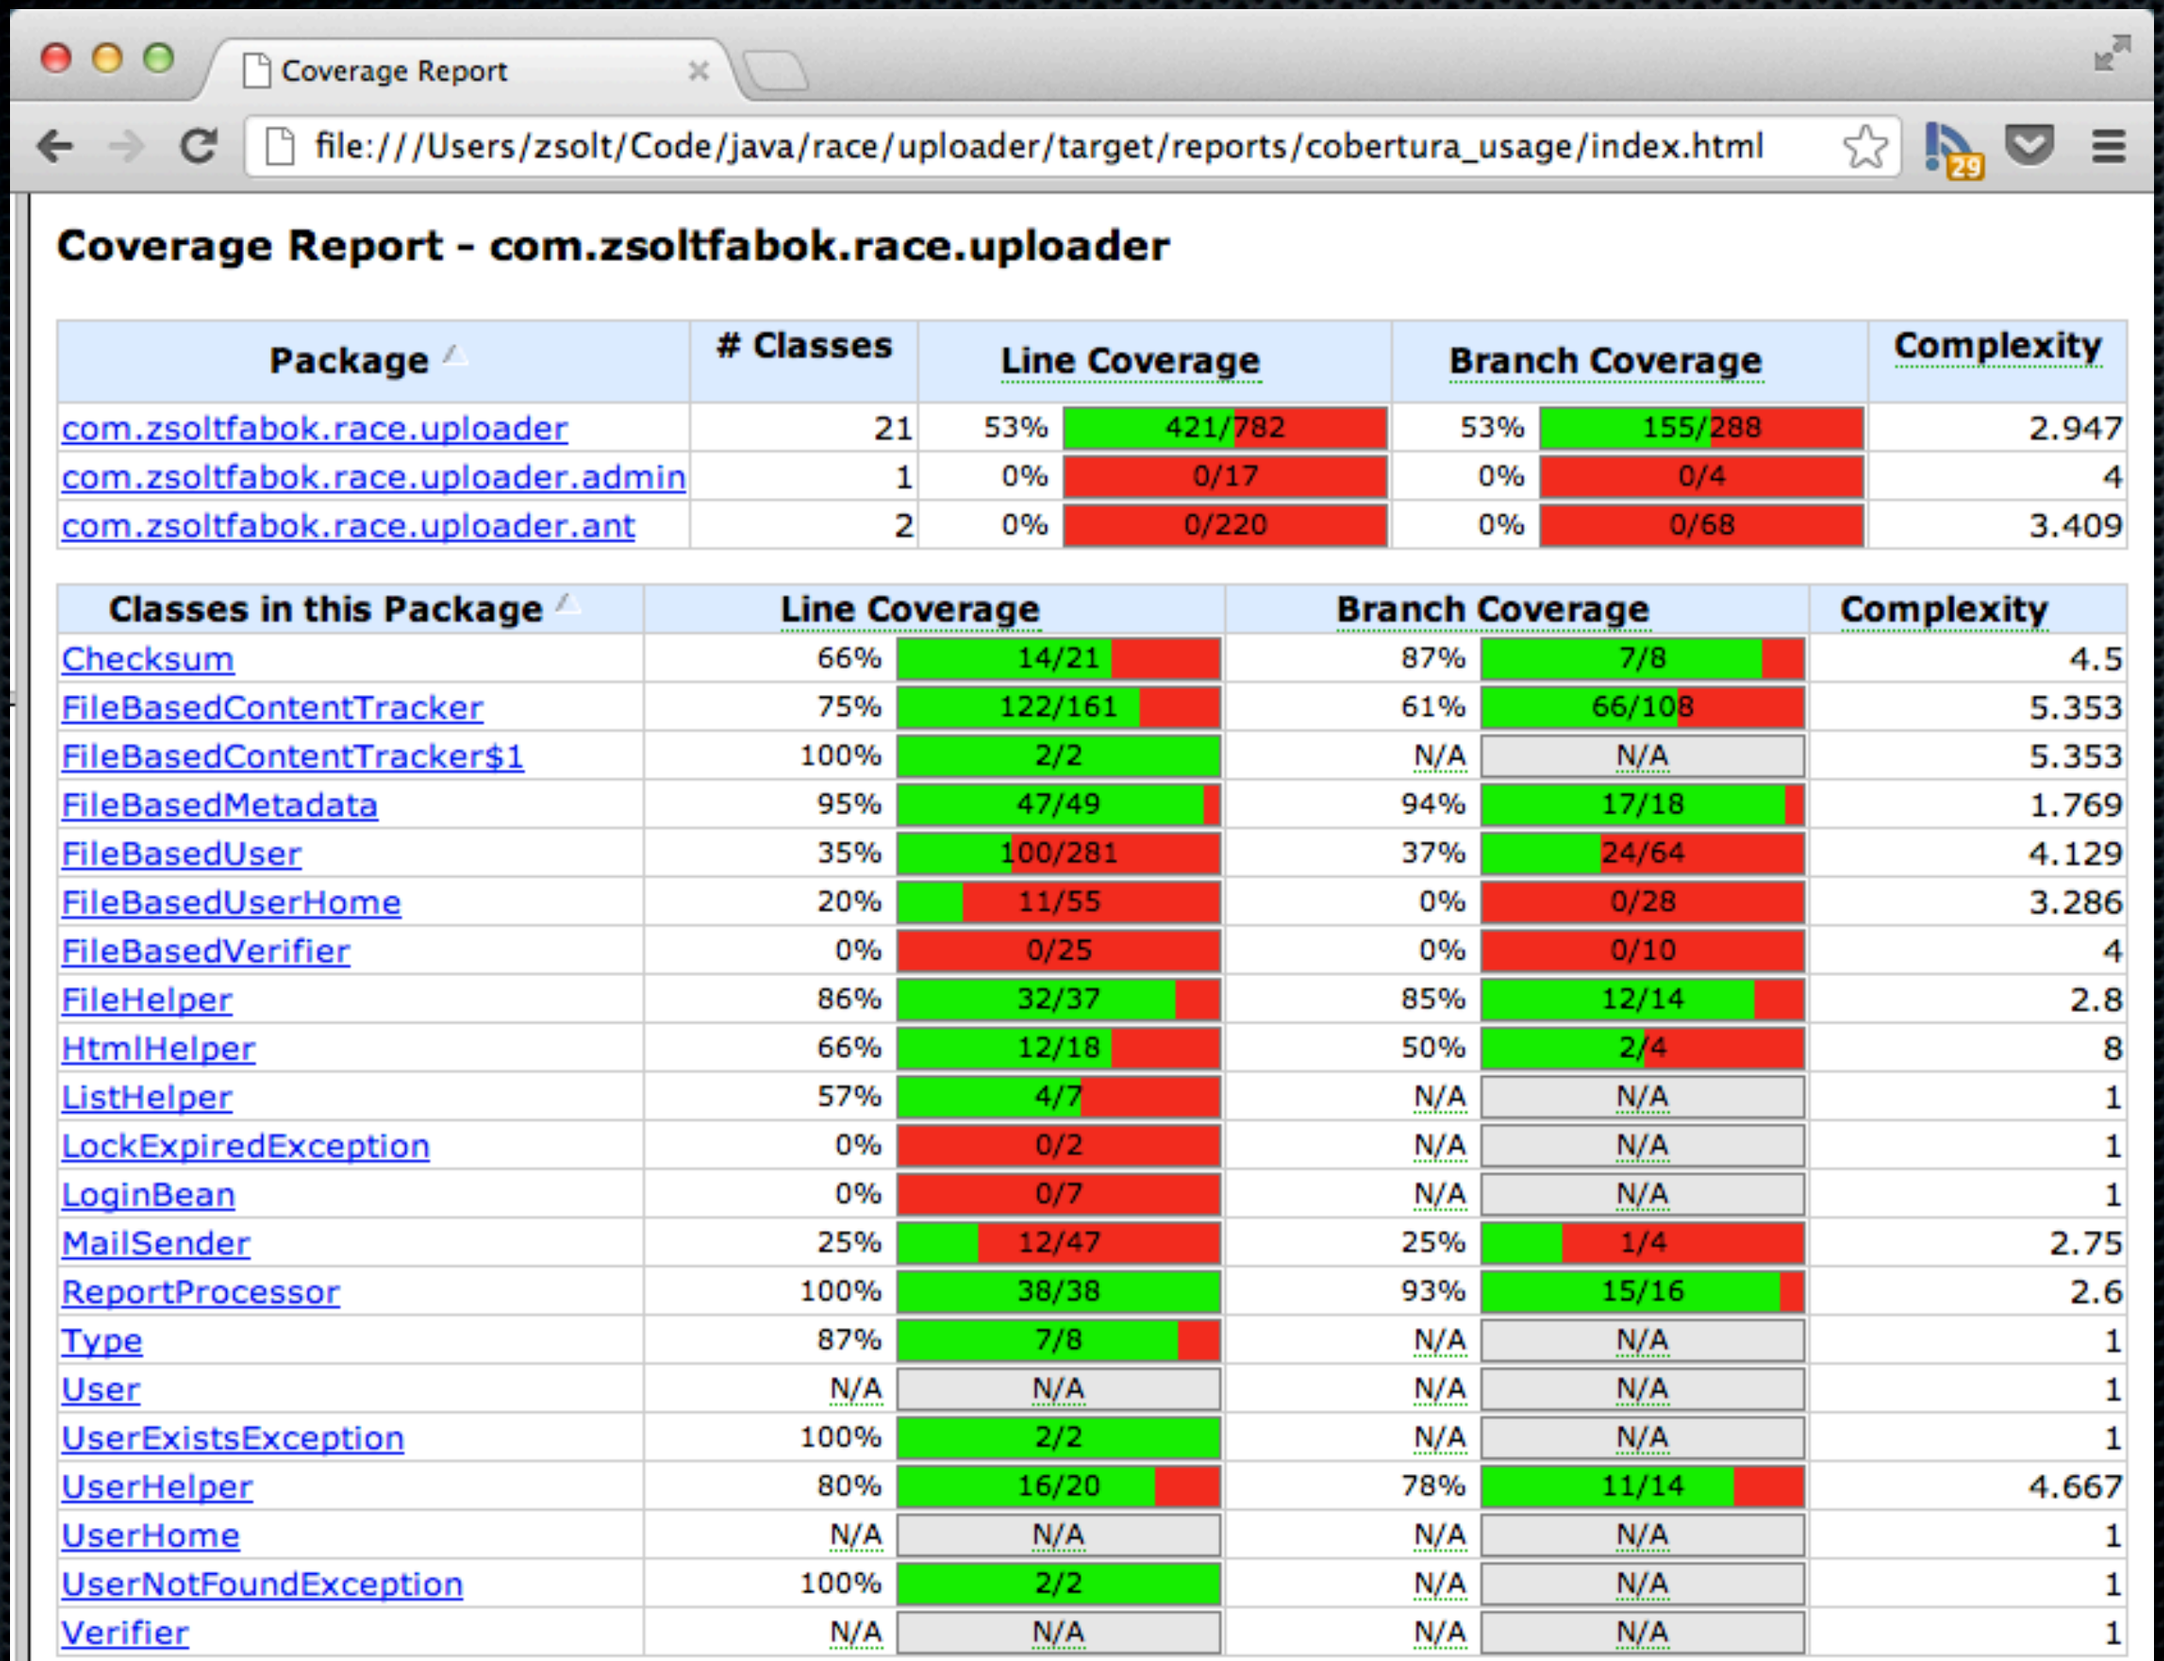
Let’s have a look at the coverage (using instrumented class files):

```
% cp jetty/cobertura.ser web.ser
% cp uploader/cobertura.ser ant.ser
% ant usage_coverage

usage_coverage:
[cobertura-merge] Cobertura: Loaded information on 12 classes.
[cobertura-merge] Cobertura: Loaded information on 11 classes.
[cobertura-merge] Cobertura: Saved information on 16 classes.
[cobertura-report] Cobertura: Loaded information on 16 classes.
[cobertura-report] Report time: 600ms

BUILD SUCCESSFUL
Total time: 2 seconds
```

Example #1: overview



Example #2: execution

Coverage Report

file:///Users/zsolt/Code/java/race/uploader/target/reports/cobertura_usage/index.html

```
 89 393            if (!disqualifiedReached) {
 90                     // Evaluate competitors
 91 381                 if (line.contains(NOT_QUALIFIED_LINE)) {
 92   3                     disqualifiedReached = true;
 93                     } else {
 94                         // Get competitors
 95 378                  Matcher matcher = competitorPattern.matcher(line);
 96 378                  matcher.find();
 97 378                  if (matcher.matches()) {
 98 180                      competitors.add(matcher.group(1));
 99                      }
100 378                 }
101                 } else {

.NET wins

FileBasedMetadata (usage)

FileHelper (usage)

#2 Find out which parts of the code change often

By checking how many times a file has been committed into VCS:

```
% ./git_stat.sh

14, VerifierTask.java
13, index.jsp
11, FileBasedUserHome.java
11, FileBasedUser.java
11, FileBasedContentTracker.java
 8, IntegrityCheckTask.java
 7, MailSender.java
```

FileBasedMetadata (usage)

FileHelper (usage)

VerifierTask (changes)

index.jsp (changes)

FileBasedUserHome (changes)

#3 Determine which part of the code changes data

Code review

"You have exactly 1 minute to explain to me what that method does!"

FileBasedMetadata (usage)

FileHelper (usage, review)

VerifierTask (changes)

index.jsp (changes)

FileBasedUserHome (changes, review)

FileBasedContentTracker (review)

Exercise 3: Code Review

#4 Determine where the code is most likely going to fail

(e.g. with static code checkers)

FileBasedMetadata (usage)

FileHelper (usage, review, bugs)

VerifierTask (changes)

index.jsp (changes)

FileBasedUserHome (changes, review)

FileBasedContentTracker (review, bugs)

FileBasedContentTracker.fsck() (crap4j)

FileBasedContentTracker.gc() (crap4j)

HarversterTask (bugs)

VerifierTask.execute() (crap4j)

Let’s order our list and we are done!

FileHelper (usage, review, bugs)

FileBasedMetadata (usage)

FileBasedUserHome (changes, review)

VerifierTask (changes)

  VerifierTask.execute() (crap4j)

FileBasedContentTracker (review, bugs)

  FileBasedContentTracker.fsck() (crap4j)

  FileBasedContentTracker.gc() (crap4j)

index.jsp (changes)

HarversterTask (bugs)

Now we know where to start, and now let's talk about how to start.

Gaining 30% coverage in 2 minutes:

```
public class CheaterTest {
    @Test
    public void shouldIncreaseTheCoverage() {
        HarvesterTask harvester = new HarvesterTask();
        Project project = new Project();
        project.setBaseDir(new File("."));
        harvester.setProject(project);
        harvester.setRepository("../repository");
        harvester.setHistory("history");
        harvester.setTemplate("templates");
        harvester.execute();
    }
}
```

Covered code != Tested code

So, you start with an assertion:

```
public class FileHelperTest {
    @Test
    public void shouldReturnTheContentOfAFile() throws IOException {
        assertEquals("", FileHelper.getFileContent(null));
    }
}
```

➡ The ‘assertEquals’ makes sure that your test actually does something

➡ The ‘null’ parameter - along with the NullPointerException - will show you where to continue

First test case is done:

```
public class FileHelperTest {
    @Test
    public void shouldReturnTheContentOfAFile() throws IOException {
        File input = File.createTempFile("foo", "bar");
        assertEquals("", FileHelper.getFileContent(input));
    }
}
```

➡ Now the test is green, let's continue with a more meaningful test case

Now we have two test cases:

```
public class FileHelperTest {
    @Test
    public void shouldReturnTheContentOfAFile() throws IOException {
        File input = File.createTempFile("foo", "bar");
        assertEquals("", FileHelper.getFileContent(input));
    }

    @Test
    public void shouldReturnTheContentOfAFile() throws IOException {
        File input = File.createTempFile("foo", "bar");
        new FileOutputStream(input).write("something".getBytes());
        assertEquals("something", FileHelper.getFileContent(input));
    }
}
```

➡ Test method names remains the same until the body is filled properly

And we are done (assertion + coverage):

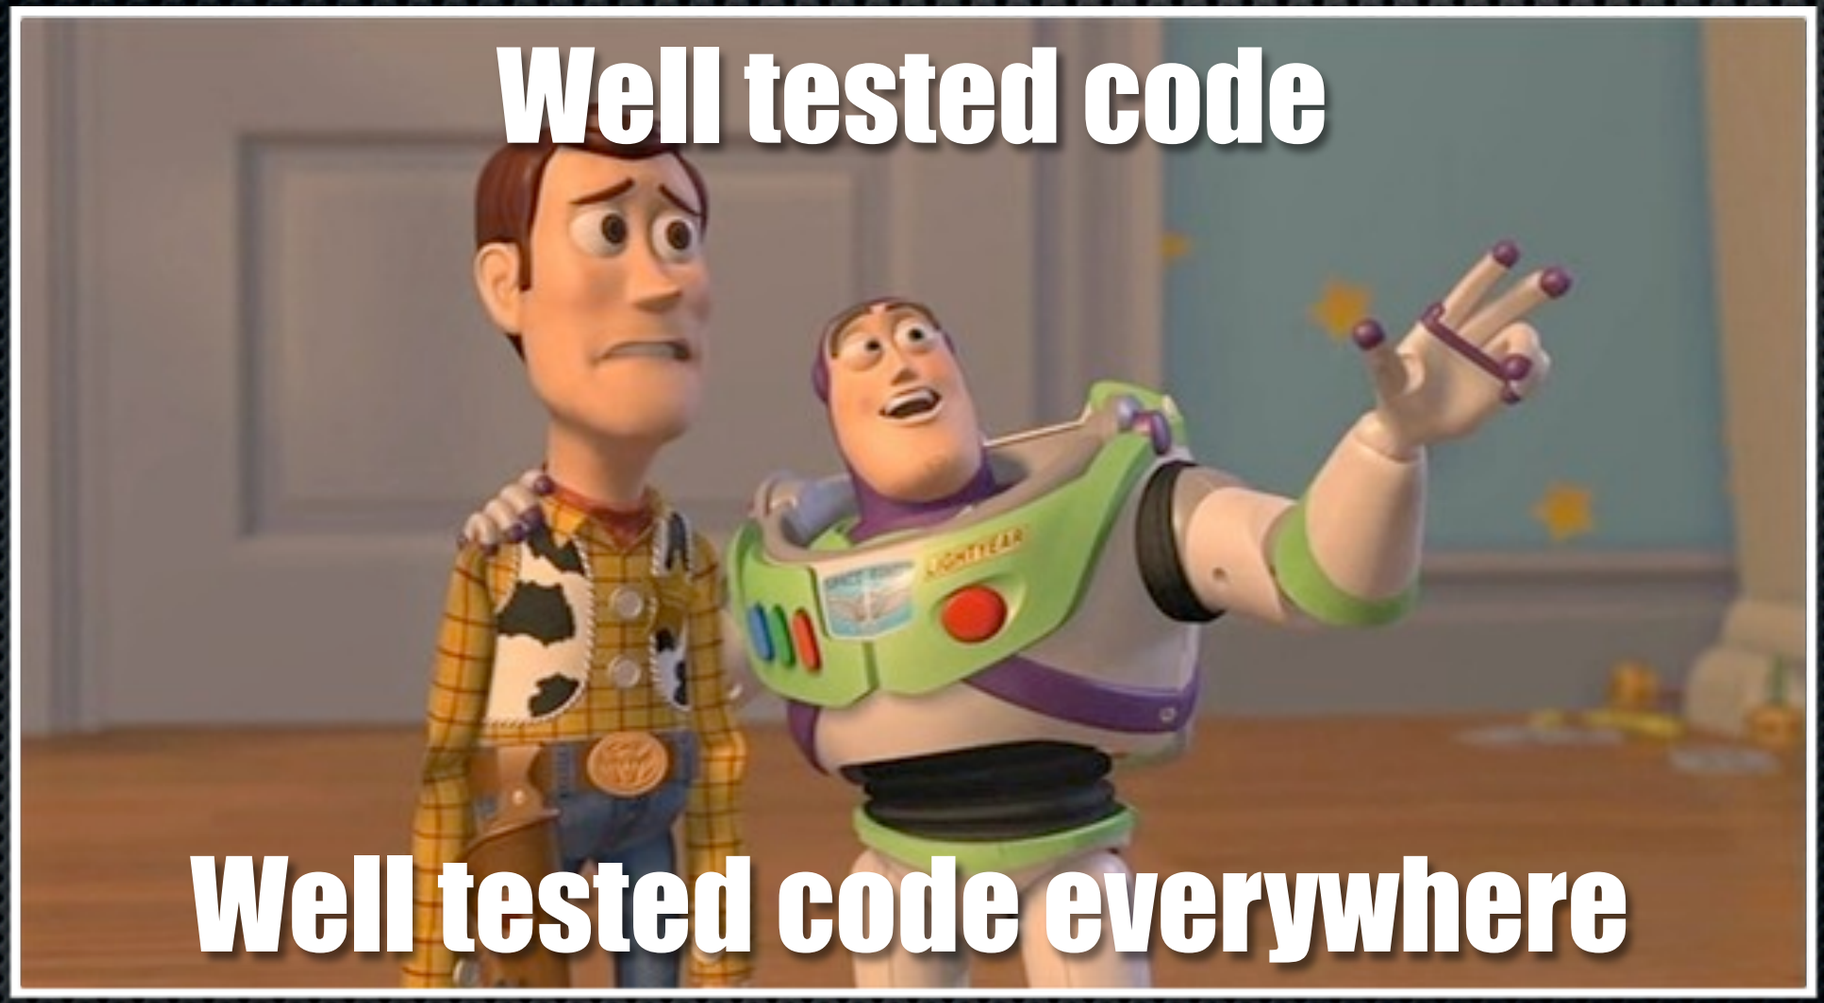
```
public class FileHelperTest {
    private File input;

    @Before
    public void setUp() throws IOException {
        input = File.createTempFile("foo", "bar");
    }

    @Test
    public void shouldReturnAnEmptyStringForAnEmptyFile() throws IOException {
        assertEquals("", FileHelper.getFileContent(input));
    }

    @Test
    public void shouldReturnTheContentOfAFile() throws IOException {
        setInputFileContent("something");
        assertEquals("something", FileHelper.getFileContent(input));
    }

    private void setInputFileContent(String content) throws IOException {
        new FileOutputStream(input).write("something".getBytes());
    }
}
```



Well tested code
Well tested code everywhere

What about web applications?

(I'll use a ruby on rails example, but the principles apply to other frameworks as well)

Points

#2 Find out which parts of the code change often (a.k.a VCS statistics)

and

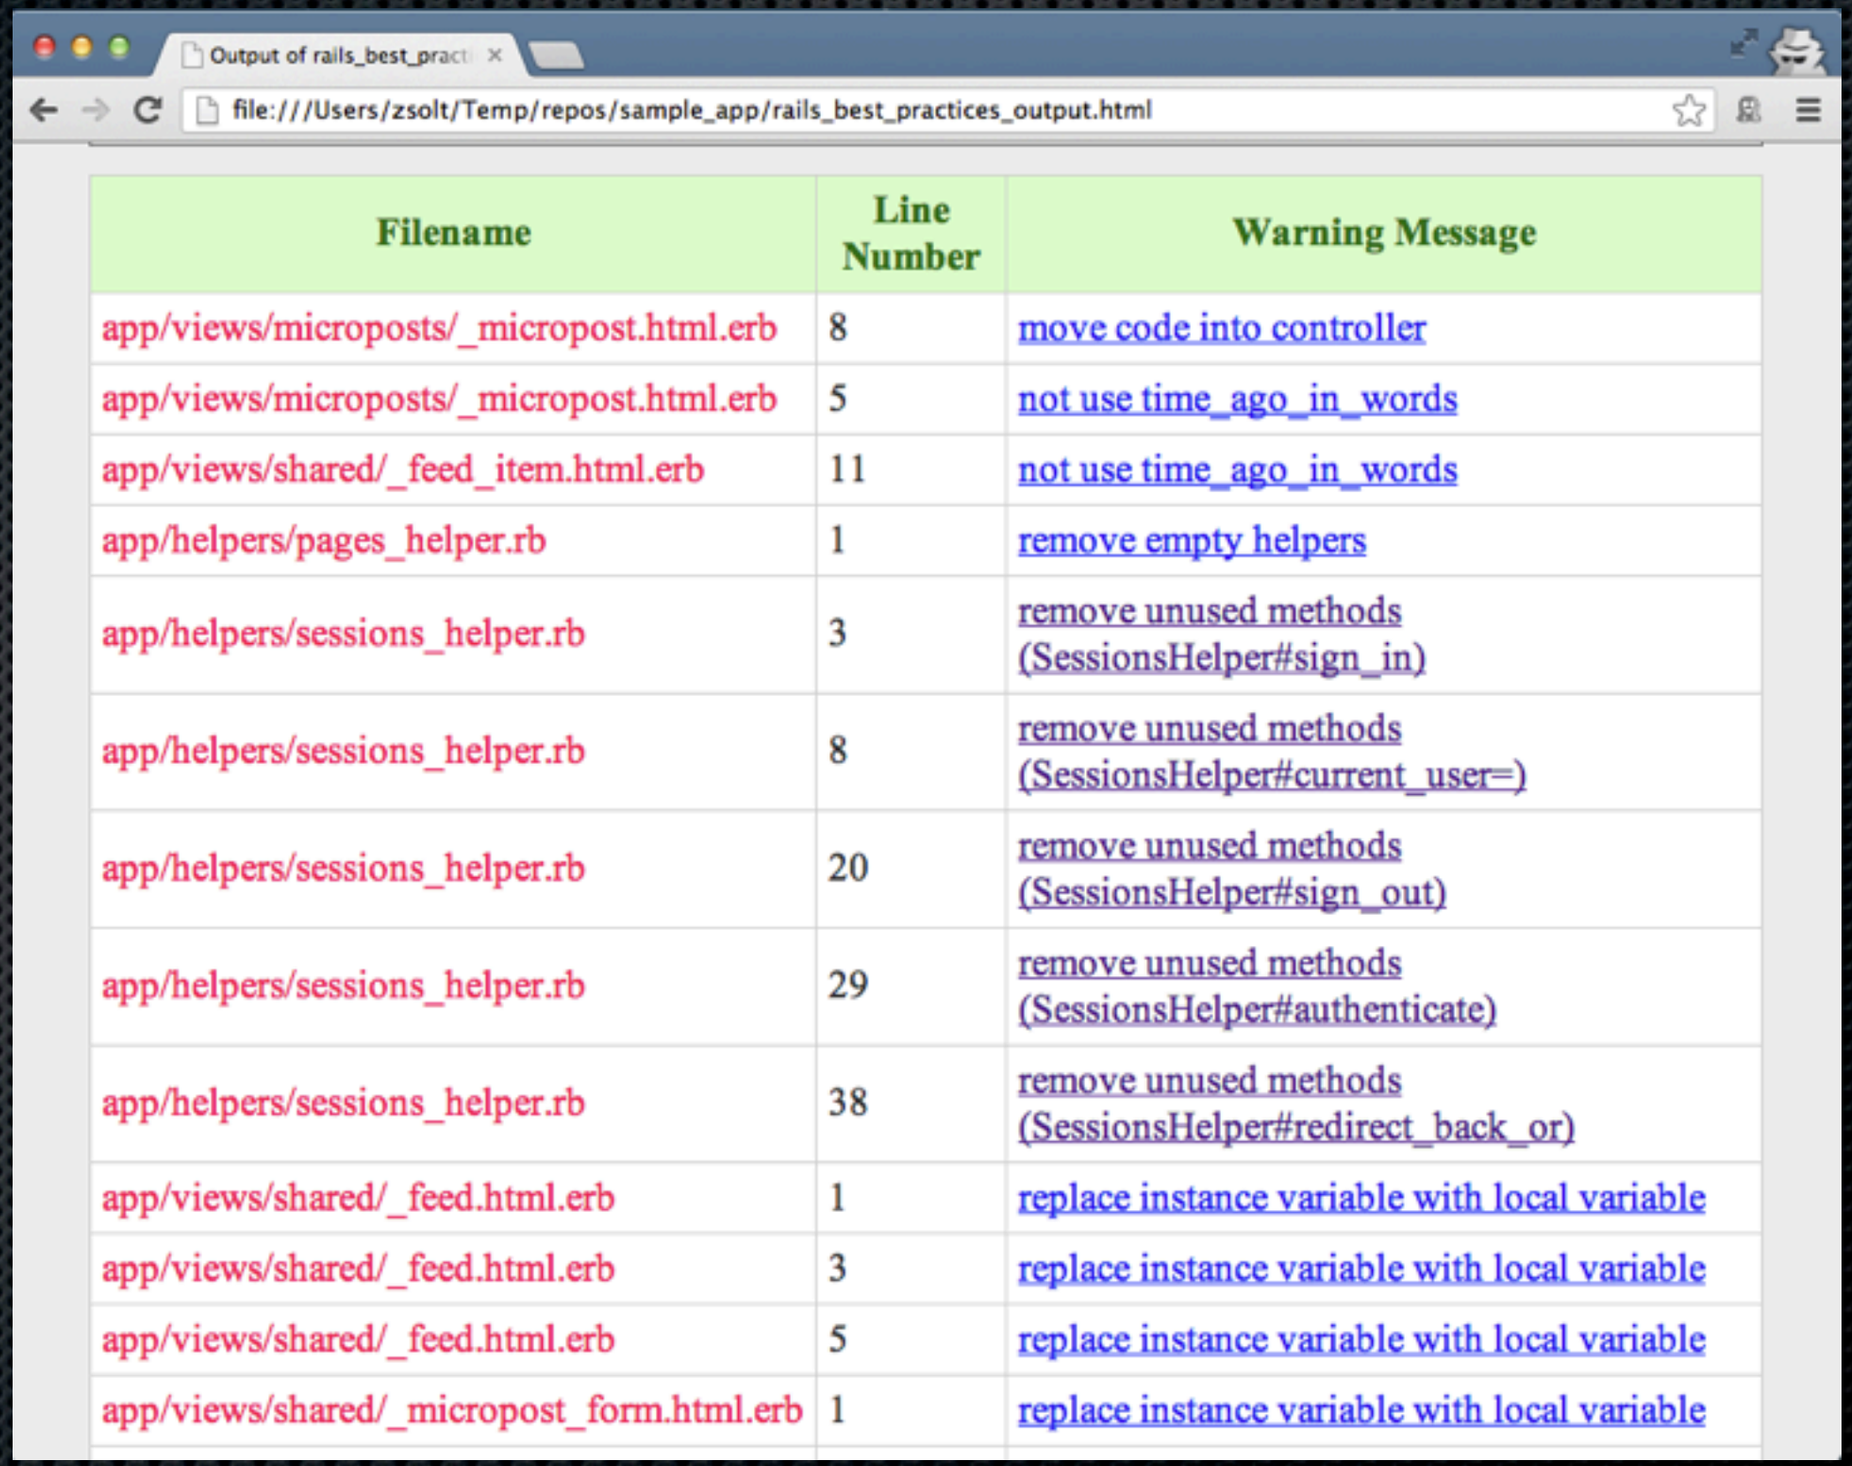
#3 Determine which part of the code changes data (a.k.a code review)

are just the same.

A large variety of tools are available for:

#4 Determine where the code is most likely going to fail (a.k.a static code checkers)

% gem install **rails_best_practices**
% rails_best_practices -html .



Filename	Line Number	Warning Message
app/views/microposts/_micropost.html.erb	8	move code into controller
app/views/microposts/_micropost.html.erb	5	not use time_ago_in_words

Everything is nice and straightforward
until now, but the last remaining point
is tricky:

#1 Determine which parts of the code
are really used (a.k.a. coverage)

We can have coverage data in Ruby on Rails, too:

```
~/Temp/repos/sample_app % gem install simplecov
~/Temp/repos/sample_app % cat script/rails
#!/usr/bin/env ruby

require 'simplecov'
SimpleCov.start do
  add_group "Models", "app/models"
  add_group "Controllers", "app/controllers"
end

APP_PATH = File.expand_path('../../config/application',  __FILE__)

# rest of the script/rails script
```

Code coverage for Sample

file:///Users/zsolt/Temp/repos/sample_app/coverage/index.html#_AllFiles

All Files (80.33%) | Models (80.7%) | Controllers (74.19%) | Ungrouped (82.11%)

Generated 13 days ago

All Files (80.33% covered at 0.96 hits/line)

21 files in total. 183 relevant lines. 147 lines covered and 36 lines missed

Search:

There is only one problem: the application must be stopped in order to get the report, which is not really efficient and user friendly.

Fortunately, we can use a metric called ‘funnel’:

Goal Funnel - Google Anal

https://www.google.com/analytics/web/?hl=en&pli=1#report/conversions-goal-funnel/a16...

www.zsoltfabok.com - http://www.zsoltfabok.com
